Drupal Training Outline

Drupal is a free and open-source content-management framework written in PHP and distributed under the GNU General Public License. It is used as a back-end framework for at least 2.1% of all Web sites worldwide ranging from personal blogs to corporate, political, and government sites including WhiteHouse.gov and data.gov.uk. It is also used for knowledge management and business collaboration.

Drupal strives to balance this by providing its users with the tools they need to make their own content management solution, while still providing some pre-built components to help them get started. Thus, it can be described both as a content management system (CMS) and a content management framework (CMF) - one system that strives to have the strengths of both, without their deficiencies. It is like a Lego kit. Skilled developers have already made the building blocks - in the form of modules - that you need to create a site that suits your needs, whether that is a news site, an online store, a social network, blog, wiki, or something else altogether.

Course Content

- What is Drupal and Why is Everyone Using It?
- What is Drupal Core?
- What are Drupal Modules?
- What Version of Drupal To Use.
- Themes installation + Configuration.
